

Rachel Meyers

The area I have chosen to identify where the depositional setting could produce future fossils is where they are building onto the 520 bridges, but I am further on the walking path, and closer to the water. The first reason I chose this is because it is where the Sound starts to integrate into Lake Washington and a larger exchange of different sediments starts to emerge. Reason number two for this location is the isolation between sound and lake bodies of water. Due to the isolated location, a third example is a chance of higher salinities that develop during high evaporation rates. Last, the area has much to offer in terms of fauna and delicate, preservable shapes like feathers.
